

BL

Master System Blueprint — One Job, Start to Payroll

Black Lee · Contractor Support Platform · colours = data layers that stack downstream

v1 · 2026-06-23

Page 1 of 2 — the flow

The one rule: colours are **not status** — they are **data layers**. Each stage inherits every colour from upstream, adds its own, and passes the bigger bundle on. Everything joins on two keys: **Client ID** (born at CRM) and **Job ID** (born at Quotation).

THE PIPELINE — 10 STAGES, TOP TO BOTTOM

The cycle repeats per job. Backend P&L + completion proof feed the next quote and the next marketing post — loop closes back to Stage 0.

THE 8 DATA LAYERS — SHARED LANGUAGE

BLUE Client — name, tel, contact, comms. <i>born: CRM</i>	GREEN Commercial — lot no/size, scope, mall, drawing. <i>born: Quotation</i>
TURQUOISE Confirmation + live job-progress status. <i>born: Job Confirm</i>	YELLOW Approved permit + worker docs (IC/passport/visa/cert). <i>born: Permit</i>
RED Resourcing — workers, lorry, visual, scaffold, fabric. <i>born: Pre-Onsite</i>	BEIGE Fabrication time/date/workers → pay calc. <i>born: Factory</i>
PINK Photos — dilapidation, in-progress, completed. <i>born: Onsite</i>	GREY CIDB insertion → manual CIMS summary. <i>born: Backend</i>

THE TWO KEYS

CLIENT-0001 Client ID One per client · carries BLUE · many jobs. Born at CRM.	JOB-0001-A Job ID One per job/lot · links to Client ID · every colour from GREEN attaches here. Born at Quotation.
---	--

ADD-ON NOTES

Mark new fields, new colours, new stages, or automations to add — bring to next session.

Architecture in one line: one shared **Job Record** keyed by Job ID in Sheet + Apps Script. No system talks to another directly — they all read & write **the record**.

READ / WRITE MATRIX — THE BUILD CONTRACT

System	Blue	Green	Turq	Yel	Red	Beige	Pink	Grey
2 · CRM	W							
3 · Smart Quotation	R	W						
4 · Job Confirmation	R	R	W					
5 · Permit	R	R		W				
6A · Pre-Onsite	R	R		R	W			
6B · Factory		R	R			W		
7 · Onsite	R	R		R	R		W	
8A · Job Completion	R	R	R		R		R	
8B · Backend + Pay	R	R	R		R	R		W

W = creates this colour once · R = reads, never edits. Build each system to honour exactly its row.

BUILD ORDER — WIRE IN THIS SEQUENCE

- 1

Lock the Job Record schema — one column block per colour, keyed by Client ID + Job ID. The contract every system signs.
- 2

Build the CRM (Stage 2) — mints Client ID, writes Blue. Nothing connects until Blue lives in one place.
- 3

Wire CRM → Smart Quotation — reads Blue by Client ID, mints Job ID, writes Green. First real win.
- 4

Retrofit existing systems — Permit, Pre-Onsite, Factory, Onsite, JCR, Backend read by Job ID, write one colour each.
- 5

WATI inbound + outbound — webhook leads in, send quotes/updates out. Slot in once method decided.

TRANSPORT — HOW DATA ACTUALLY MOVES

WATI → CRM: webhook → Apps Script **doPost(e)** → append row, mint Client ID

CRM → Quotation: reads Blue by Client ID, mints Job ID · same Sheet, no export

Quotation → Client: auto-send quote + stored measurement via **MailApp** / WATI

Any system → Job Record: read by Job ID, write only own colour columns

Permit → Building mgmt: auto-email permit + docs + MOS + HIRARC · replies → v2, v3...

Job Completion → Client/Wix/LinkedIn: email + save-mode social drafts for manual post

Backend → CIMS/Infotech: prepares summary, human submits (manual for now)

STATUS TODAY

Your own builds (Sheet + Apps Script) — used in place of ClickUp + Odoo

WATI — method still being decided

Infotech (invoice) & CIDB CIMS — still manual, future automation targets

Owner names (Imrah, Eason, Sohel, Katm, Afiqah, Ainaa) — read from sketch, confirm

DECISIONS NEEDED (CRM)

1. Client ID format? 2. De-dupe = same phone? 3. Who keys leads now? 4. Migrate existing client list? 5. Repeat client = 1 ID, many jobs?
